

Species List of the Lepidoptera of the Outer Hebrides

(Revised June 2025)

Introduction

The list of species recorded in the Outer Hebrides (VC110) is compiled from records in the Outer Hebrides Biological Recording (OHBR) database, supplement records from the National Biodiversity Network Atlas Scotland^{1,3} and historical records from the scientific literature.

Over 2500 species have been recorded in the British Isles and so far, 613 moths and 20 butterflies appear in the Outer Hebrides checklist. This is not a definitive list; it does not include all the species recorded in literature² or in museum collections. In comparison with other insects, moths and butterflies are well documented. However, parts of the archipelago are under-recorded, and we are still adding new species to the list. If you record a species not currently listed and submit your record to OHBR you will be requested to supply further information on how the species was identified to enable us to verify the record. Please note that some species can only be identified by dissection.

The species number is the new checklist number, used in the *Checklist of the Lepidoptera of the British Isles* (Agassiz, D.J.L., Beavan, S.D. & Heckford, R.J. 2013)⁴. This list has been revised and we are using the scientific names used in the current update (British Lepidoptera 2024)⁵. We have not adopted the trinomials used in this list as most recorders only use binomials., and the vernacular names of the micromoths have been revised to comply with those used in the 2nd edition of Sterling & Parsons⁶.

We would like to acknowledge the contribution made by John Kemp and Robin Sutton in checking and validating the records submitted to OHBR and in promoting the recording of Lepidoptera in the islands.

Notes

1. Common Rustic (*Mesapamea secalis*) is almost identical to Lesser Common Rustic (*Mesapamea didyma*) and although there is a size difference in many specimens (as the name suggests), there is too much overlap to use it as a reliable character in identification. Therefore, we have retained *Mesapamea secalis* agg. for recording purposes where determination by genitalia examination has not been conducted.
2. The Ear Moths are all very similar and can only be reliably identified by reference to the genitalia. Therefore, we have retained *Amphipoea* for recording purposes.
4. The status of Arran Carpet has been changed and it is now classified as a subspecies of Common Marbled Carpet. It is a race or ecotype of *Dysstroma truncata* which behaves as a species on some Scottish islands.
